

Example

Aaron spent $\frac{1}{4}$ of his money on a book. He spent $\frac{3}{4}$ of the remaining money on a DVD.

(a) What fraction of his money was left?

(b) If he had left \$12, how much money did Aaron have at first?

Method 1 (Model)

The fraction still represents the remainder and not the whole.

The remaining parts (which is $\frac{3}{4}$ after Aaron spent $\frac{1}{4}$ on a book) need to be divided in the model so as to make the parts representing the parts and the whole the same.

Since we cannot calculate $\frac{3}{4}$ of 3 units directly, each box will be sub-divided into 4 smaller sub-units, so that $\frac{3}{4} \times 12 \text{ units} = 9 \text{ units}$
